## INTRODUCTION.

---

The 160 photographs of 80 men herewith reproduced for the St. Louis Exposition represent 43 provincial types found in Bilibid Prison in 1903. The student in America may refer to the exhibit of 1,024 photographs and 128 casts in the Exposition, contributed at the same time, which are later to be placed in the National or other museums.<sup>1</sup>

The great Philippine penitentiary contains about 3,000 men. Reasons might be given to justify the writer's impression that they are in large measure fairly typical, physically, of the populations from which they come. The most of them come from the tribes officially denominated "Christian." The only non-Christians found in Bilibid are included in the Album. All the great Christian peoples are represented, and 37 provinces. The individuals here presented have passed through three processes of selection. First, all the men available from a given province, in some cases over one hundred, were lined up by height, and from twenty to fifty, where possible, these being of all heights, were taken for measurements. Secondly, from the ranks of these chosen men a selection was made by intervals for photographs and for more minute study; the resulting list was thus fairly representative of the chief physical types; if any were manifestly abnormal they were rejected. Thirdly, from the large number of photographs thus obtained for the exhibit, fifteen or twenty in the case of some provinces, it was aimed to select two of the best for the Album. As will be seen from the record of measurements printed opposite each photograph, the men selected were generally those nearest the average of their province, although this was impossible in some cases.

Some cautions must be noted. It is needless to say to those acquainted with the art that photographs are not mathematically exact. A superior portrait lens was used in a portion of this work, but distortion was evident in the employment of another lens. It was practically impossible also to turn out this large amount of work exact to a scale and at the same time in good focus. However, there are but few cases in which the variation is greater than one-eighth of an inch upon the ground glass from the proportion fixed upon, one-half the natural size. The second caution relates to the small number of cases obtainable from certain

---

<sup>1</sup> It is suggested to those having access to the exhibit of photographs above mentioned that by their means interesting studies may be carried further than the author has thus far done. It is believed, for example, that a count of the 612 full-length photographs will corroborate a preliminary count of about two hundred men made while measuring them—nine-tenths of whom were circumcised. These were mainly Tagalogs, but the same proportion is believed to hold true of the other Christian peoples.

provinces. It is evident, for instance, that neither the photographs of the only Igorrote nor that of the only Monobo found in the prison can be safely regarded as typical; nor can those of the small group of Negritos, three of the northern type and one, or possibly two, of the southern. There is not equal danger of error, however, in the case of provinces or islands having but two or three representatives each in the prison, as Catanduanes or Romblon. Their purity of type is evident upon comparing them with their neighbors of the same tribe. In the case of the Moros, two each from Basilan and Cottabato, there is greater doubt, because the entire number of Moros in the prison is small—only twenty. Indeed, as there are evidently two distinct Moro types, one of Zamboanga and the other of the islands to the west, the number of cases is doubly reduced upon which we may generalize. The ten men from Jolo probably give a fair idea of the Jolo type. The same is probably not true of the eight men from Mindanao, where there is presumably less evenness of type. Compare with this the great number of men selected for measurements from the Visayan group, 259—46 from a single province, Leyte; or the 193 Ilocanos selected, 59 from Ilocos Sur alone; or the 62 Pampangas from Pampanga, the largest number selected from any province. It is evident that here we have a safe basis for inductions as to physical type.

The Bicol (Pls. 1-7), whose portraits come first in the alphabetical arrangement of the Album, have been presented as typical of all the Christian peoples of the Philippines by so good an authority as Montano. It must be said, however, that the measurements made upon 63 Bicol in Bilibid Prison place them next to the bottom of the scale in height among the 838 measured. They are typical, however, in an important factor, the cephalic index. Their length of head being considered as 100, its breadth is 83.34. This puts them in the "brachycephalic" or short-headed class of peoples, as are all Malays. They have, of course, the other primary Malay characteristics—a brown skin, sometimes approaching the Mongolian yellow; straight, black hair; a low stature (the Bicol are but 5 feet 2½ inches in height), and a rather broad nose. They are not as platyrhinian or broad-nosed as are negroes; in proportion to the height the Bicol's breadth of nose averages 83.34, making him mesorhinian. The features approach the Mongolian in other respects—rather high cheek bones, a noticeable projection of the jaws and lips, and even in some cases a slanting of the eyes. The so-called Malay characteristic, a flattening of the back of the head, "en coup de hache," as the Frenchman just mentioned expressed it, was found in less than a fourth of the cases in Bilibid, among Bicol and most other peoples as well. The prison cut of hair allows an examination of the photographs in this detail, although it gives an imperfect idea otherwise of the luxuriant growth of hair, often worn in pompadour or thrown back in great masses from the forehead.

The Cagayans (Pls. 8-11) present what seems to be a distinctly northern type of "Indios" or Christian Filipino peoples, as contrasted with the southern type well represented by the Bicol. One of the results of the anthropometrical work done in Bilibid

would seem to be a demonstration of the need of this classification. As compared with each other, the northerners are tall and long-headed, the southerners short and broad-headed. The average height of the Cagayans, like that of the entire northern group, is 5 feet 4 inches. The Cagayans differ from other northerners, however, in having a very broad nose, slightly broader even than the average southern nose. They rather excel in regularity of features. The nose, although short, is generally straight. Their prognathism or projection of the lower part of the face is but slight. Their span of arms in proportion to the height of the body is less than that of any other Indios with the exception of the Pamampangas. To judge from the eighteen found in Bilibid, their color is darker, also, than that of others, as dark as that of the Moros—that is, they are of a reddish rather than a yellowish brown. Like all Malays they are practically beardless.

The Ilocanos (Pls. 12–22) are interesting in that they seem to be not one homogeneous people, physically, but in part southerners and in part northerners; and, more strangely yet, those of the southern type occupy the provinces that extend to the extreme north of Luzon. To make sure of this unexpected conclusion, larger numbers were measured from the Ilocano provinces than from any others in the Archipelago. The result seems unquestionable. The southern Ilocos are tall and long-headed, like the Cagayans just described, while the inhabitants of Ilocos Norte, Ilocos Sur, and Union Provinces are shorter and more brachycephalic, like the Bicolis. The only explanation which suggested itself is that the latter provinces, being more truly coast lands than the others, although far to the north, have preserved the “littoral” or lowland type that characterizes all the southern Indios and represents, perhaps, the last Malay wave of migration; while the so-called “Ilocanos” of Pangasinan and Tarlac are at least by mixture partly Pangasinan, or of the highland and northern type and blood.

The famous Moros (Pls. 23–31), or Mohammedan peoples of the southern islands, must be classed physically with the Christians, the “Indios.” Indeed, they are not so unlike the average “Neo-Malay,” as the whole group may be called, as are others of their southern kinsmen. While the Bicolis and Visayas are the shortest of all the group, the Moros approach the average. Indeed, in length of head they resemble the northerners more than the southerners. On the other hand, they excel all other southerners in breadth of nose. There are evidently two types of Moros—a purer type, no doubt, on Jolo and the smaller islands, and a type on Mindanao which approaches in characteristics the tall “Indonesians” of the interior of that island with whom they have probably mixed.

The Pamampangas and Pangasinans (Pls. 32–38), who come next in order, are members of the northern division and differ but little between themselves excepting in the shape of the head. While the Pamampangas have the longest heads in relation to breadth

of all the Neo-Malays, the Pangasinans are more brachycephalic than even the average southerner. Both these peoples living further from the coast than the shorter-headed Ilocanos to the north of them, Tagalogs to the south, and Zambals to the west, it may be presumed that they obtained their "northern" characteristics from the tall "Primitive Malayan" or "Indonesian" element of the interior. In still other respects they approach slightly the Caucasian type, having as compared with other Neo-Malays a relatively straight nose and a lighter, yellowish color. Some writers think that the latter feature and the slanting eyes sometimes found amongst them indicate an admixture of Chinese blood and corroborate the ancient tale of a certain Chinese pirate who settled with his followers in the interior.

The great Tagalog people (Pls. 39-50) are represented in this Album by seven provincial types, ranging from Tayabas in the south to Nueva Ecija in the north. They represent fairly well, especially the Tagalogs of Cavite, the average man physically of all the Neo-Malays, northerners and southerners combined. Especially is this true of the important characters, the shape of the head and of the nose. In height, however, they resemble the southerners more than the northerners. Their average is 5 feet 2½ inches. About four-fifths of those in the prison are of the lighter, yellowish brown. This may be due to the strong infusion amongst them of the Chinese element. Indeed, the Manila contingent in the prison was so preponderatingly Chinese—three-fourths of the men admitting that they have mixed blood of one sort or another—that this group was rejected entire as unsuitable for a study of Philippine types. One-third of the Tagalogs examined have a noticeable approach to the Mongolian eye; about the same proportion possess something of the Malay flattening of the head.

The Visayas (Pls. 51-71) are the great people of the southern Philippines as the Tagalogs are of the north. While our Tagalog types are all from Luzon, the Visayan types are scattered over ten or twelve large islands. They are on the average shorter than the other peoples here discussed. They also have the greatest span of arms in proportion to height and, with one exception, the broadest heads and noses relatively to length. The Visayas of some islands, however, are taller decidedly than those of other islands. Especially is the tall, broad-headed type characteristic of Misamis, owing no doubt to its mixture with the tall "Indonesian" element of the interior. The opposite sides of the Island of Negros are peopled by the most opposite of Visayan types, the shorter type of Negros Occidental being due to the admixture of Negrito blood. The Visayas seem somewhat darker than the Tagalogs, and the pug nose is more pronounced.

The Zambals (Pls. 72, 73) are small in number, both in the prison and outside. If we may generalize from the seventeen cases in Bilibid, they stand nearer the average of the Neo-Malay types in all essential characters than do any other people. Their height is in the average exactly the general average, 5 feet 3¼ inches. As compared with Caucasian and other races, they are

moderately short-headed; that is, brachycephals of the index 82.68; while their nasal index, 79.63, places them among the mesorhins; that is, neither extremely broad nor narrow of nose.

The Igorrote (Pl. 74), and in fact all of whom it remains to speak, can not be regarded with certainty as types. They are too small in number. The Igorrote is not only widely different from all the Neo-Malays; he seems to approach the Caucasian too much to be even a pure "Indonesian." He has very regular features, a skin that shows the vermillion tinge, eyes of a light brown, and a considerable beard. He is, however, shorter than even the Neo-Malays of the north. On the other hand his span of arms is, in proportion to his height, less than theirs.

The Manobo (Pl. 75) represents the Indonesian stock of the south as the Igorrote should the same stock of the north. The former is, according to the ordinary printed descriptions, a fair type, although perhaps too tall, 5 feet 6 inches, far above other Philippine types. His body is well proportioned. While he would be claimed by leading French anthropologists, as Quatrefages and Hamy, and by Montano, who has thoroughly studied this people, to be Caucasian in his ethnical affinities, he is quite dark, darker in fact than most of the Neo-Malays. The painter would call his hue that of burnt umber, approaching burnt sienna. The general expression of the face reminds one in a vague way of the Caucasian type; yet his nose is short, his cheek bones high, and his jaws and lips rather projecting. He has dark-brown eyes. His hair, although as black as a Malay's, is said to have been wavy before it was cut.

The Negrito, Vicente Gutierrez, of Bataan Province (Pl. No. 76), would be accepted by the writer as an excellent type of the few Negrito families that he has seen near Mariveles in that province. Yet Vicente insists that his mother is a Tagalog. The same difficulty applies to at least four of the five Negritos here presented. The three of Bataan stock, who appear acceptable in type, claim to be mestizos; while the man from Negros, who insists most strenuously upon being a Negrito, is not believed by the writer to have any Negrito blood in him. There is testimony, as well as ethnical evidence, to his being a native of India. He is far different from any Philippine type, as will be seen by consulting his photograph (Pl. 80). He is different also in color, very dark, with almost a bluish tinge.

The truer Negritos (Pls. 76-79), those from Bataan and Negros, present two types. Although alike in color and hair, the southern type seems taller. They are both much longer headed than the Philippine Malays and much broader in nose, two of the Bataan men having noses broader than long. The color, however, is not so dark as that of the supposed Indian of Negros, but little different, in fact, from the darker brown which is common among the Christian Filipinos.

## A BICOL OF ALBAY PROVINCE.
